#### Session 1 1

#### 1.1 Calculus

Calculus: study of changes.

2 types of calculus: differential and integral calculus.

Differential: distance  $\rightarrow$  speed Integration : speed  $\rightarrow$  distance

#### Derivative 1.1.1

### Definition

The derivative is the slope of the tangent line on a point.

Definition: The derivative of f at  $x_0$  is the slope of the line tangent to the graph of f at  $x_0$ .

$$\lim_{\Delta x \to 0}; \frac{f(x_0 + \Delta x) - f(x_0)}{\Delta x} = f'(x_0)$$

Some derivatives 
$$f(x) = \frac{1}{x}(x > 0)$$
 
$$\frac{\Delta f}{\Delta x} = \frac{\frac{1}{x_0 + \Delta x} - \frac{1}{x_0}}{\Delta x} = -\frac{1}{x_0^2 + x_0 \Delta x}$$

$$f'(x_0) = \lim_{\Delta x \to 0}; -\frac{1}{x_0^2 + x_0 \Delta x} = -\frac{1}{x_0^2}$$

$$f(x) = x^n$$

$$f'(x) = \lim_{\Delta x \to 0}; \frac{(x + \Delta x)^n - x^n}{\Delta x} = \lim_{\Delta x \to 0}; \frac{(\binom{n}{0}x^n \Delta x^0 + \binom{n}{1}x^n \Delta x^1 + \dots) - x^n}{\Delta x} = nx^{n-1}$$

$$(f+g)'(x) = f'(x) + g'(x)$$

## Continuity

Notations:  $f'(x) = \frac{dy}{dx} = \frac{df}{dx} = Df = \frac{d}{dx}f = y$ 

Example: 400 ft,  $y = 400 - 16t^2$ 

 $400 - 16t^2 = 0$ 

t = 5

On average, -80 ft per second. But we want to know the instantaneous speed when the pumpkin hits the ground:

f'(x) = -32t

$$f'(5) = -160ft.s^{-1}$$

f(x) is continuous at  $x_0$  if

$$\lim_{x\to x_0} f(x) = f(x_0) \Leftrightarrow \lim_{x\to x_0} f(x) - f(x_0) = 0$$

**Theorem**: If f is differentiable at  $x_0$  then f is continuous at  $x_0$ 

$$\lim_{x \to x_0} f(x) - f(x_0) = \lim_{x \to x_0} \frac{f(x) - f(x_0)}{x - x_0} (x - x_0) = f'(x_0) = 0$$

### Derivatives of composed functions

$$(u+v)'(x) = \lim_{\Delta x \to 0}; \frac{(u+v)(x+\Delta x) - (u+v)(x)}{\Delta x}$$
$$= \lim_{\Delta x \to 0}; \frac{u(x+\Delta x) + v(x+\Delta x) - u(x) - v(x)}{\Delta x}$$
$$= u'(x) + v'(x)$$

$$(uv)' = u'v + v'u$$
$$(\frac{u}{v})' = \frac{u'v - v'u}{v^2}$$

$$\lim_{x \to 0}; \frac{\sin x}{x} = 1$$

$$\lim_{x \to 0}; \frac{\cos x - 1}{x} = 0$$

$$f'(x) = \frac{d}{dx}\sin x$$

$$dx$$

$$= \lim_{x+\Delta x} \frac{\sin(x+\Delta x) - \sin x}{\Delta x}$$

$$= \lim_{x+\Delta x} \frac{\sin x \cos \Delta x + \sin \Delta x \cos x - \sin x}{\Delta x}$$

$$= \lim_{x+\Delta x} \frac{\sin(\cos \Delta x - 1)}{\Delta x} + \lim_{x+\Delta x} \frac{\cos x \sin \Delta x}{\Delta x}$$

$$= 0 + \cos x$$

Chain rules y = f(g(t))

$$\frac{dy}{dt} = \frac{dy}{dx}\frac{dx}{dx}$$

$$\begin{aligned} y &= f(x) = \sin x \\ x &= g(t) = t^2 \\ y &= \sin(t^2) \end{aligned}$$
 
$$\frac{d}{dt}(\sin t^2) = (\frac{dy}{dx})(\frac{dx}{dt}) = (\cos x)(2t) = \cos(t^2)2t$$
 
$$f(g(x))' = g'(x)f'(g(x))$$

Implicit differntiation y = f(x) $x^2 + y^2 = 1$ 

$$\frac{d}{dx}(x^{a}) = ax^{a-1}$$

$$a = m/n; y = x^{m/n}; y^{n} = x^{m}$$

$$ny^{n-1} \cdot \frac{dy}{dx} = mx^{m-1}$$

$$\frac{dy}{dx} = \frac{m}{n} \frac{x^{m-1}}{y^{n-1}}$$

$$= \frac{m}{n} \frac{x^{m-1}}{x^{m-1}}$$

$$= \frac{m}{n} \frac{x^{m-1}}{x^{m(n-1)}}$$

$$\frac{m}{n} x^{\frac{m}{n}-1} = ax^{a-1}$$

 $\cos a + b = \sin a \cos b + \cos a \sin b \sin a + b = \cos a \cos b + \sin a \sin b$ 

## 1.2 Differential equations

We can note derivative with  $D^n$  with n the degree of the derivative.  $D^2x^n=n(n-1)x^{n-2}$  so generalizing :

$$D^{n-1}x^n = n(n-1)...2x^{n-(n-1)}$$
  
= n!x

For a bacterial population,  $y_0$  is the initial site of the population, t is the time in days. The bactrias double every days.  $y(t) = 2^t y_0$ 

 $A_0$  is the inital amount, n the number of years, the interest rate is 5%.  $A(n) = A_0(1.05)^n$ 

$$\frac{d}{dx}a^{x} = \lim \Delta x \to 0; \frac{a^{x+\Delta x} - a^{x}}{\Delta x}$$

$$= \lim \Delta x \to 0; \frac{a^{x}(a^{\Delta x} - 1)}{\Delta x}$$

$$= a^{x} \lim \Delta x \to 0; \frac{a^{\Delta x} - 1}{\Delta x}$$

$$with \frac{d}{dx}a^{x} = a^{x}M(a)$$

$$\frac{d}{dx}a^{x}_{x=0} = a^{0}M(a) = M(a)$$

$$So: \frac{d}{dx}e^{x} = e^{x}$$

 $f(x)=2^x$  initial function for wich we want to comute the derivative.  $f(kx)=2^{kx}=(2^k)^x=b^x$  (with  $b=2^k$ ) So f'(kx)=kf'(kx)

$$\frac{d}{dx}b_{x=0}^{x} = kf'(0) = M(2)k$$

If  $y = e^x$  then  $\ln y = x$ 

#### Linear Algebra 1.3
